Flanigan Square, 547 River Street, Troy, New York 12180-2216

Antonia C. Novello, M.D., M.P.H.
Commissioner

Dennis P. Whalen
Executive Deputy Commissioner

April 4, 2001

Arnold Bernadini
Assistant Vice President
Facilities & Planning
SUNY College at New Paltz
75 South Mannheim Boulevard
New Paltz, N.Y. 12561

Dear Mr. Bernadini:

Air and wipe samples were collected in January 2001 at SUNY New Paltz for PCB analysis. These samples were collected from surfaces in five campus buildings that were sealed with encapsulant material because they could not be cleaned, or removed, to comply with the SUNY New Paltz PCB clean up criteria. Sampling and analysis was conducted in accordance with the clean up protocols established for this site and according to generally accepted methods for environmental sample collection and analysis. All analyses were conducted by the New York State Department of Health Laboratory.

Wipe samples were collected in 21 locations in former transformer vaults and electrical rooms. Samples could not be collected from the loading docks surfaces of Scudder Hall and Parker Theater in January 2001 because these surfaces were not accessible. A wipe sample was collected in the former Capen Hall transformer vault at the request of the SUNY New Paltz Health & Safety Coordinator. Air samples were collected in seven areas of the five affected buildings.

The levels of PCB Aroclor 1260 in the January 2001 wipe samples ranged from 0.01 micrograms per centimeter squared (MCG/cm.sq.) to 0.28 MCG/cm.sq. No other Aroclors were detected above the laboratory method detection limit. Aroclor 1260 levels in the February 1998 samples ranged from 0.01 MCG/cm.sq. to 0.73 MCG/cm.sq. Aroclors 1016/1242 were also detected at trace levels on some surfaces in each sampling location. None of the 1998 or 2001 wipe samples exceeded the PCB surface clean up criterion of 1 MCG/cm.sq. The analytical results of the PCB wipe samples collected in February 1998 and January 2001 are summarized in Table 1.

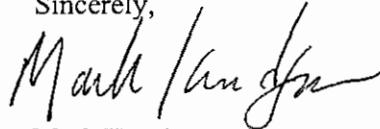

No PCB Aroclors were detected in the 2001 air samples above the laboratory method detection limit of 0.2 micrograms per cubic meter (MCG/Cu.M.). The February 1998 air sample results indicated Aroclor 1260 detection in only one area; the Gage transformer vault. Aroclors 1254 and 1016/1242 were present, but less than the detection limit, in several areas. The transformer fluid that was spilled during the December 1991 incident contained primarily Aroclor 1260. None of the 1998 or 2001 air samples exceeded the clean up criterion of 1 MCG/Cu. M. The results of the February 1998 and January 2001 air samples are summarized in Table 2.

Levels of PCBs in the January 2001 wipe samples are similar to, or less than, the levels of PCBs in the February 1998 samples. PCB levels in air sample results have decreased to below the method detection limit. The levels of lower molecular weight Aroclors (1016, 1242, and 1254) have also decreased to below the method detection limit over this testing interval. These data indicate that the PCB levels on surfaces and in the air are decreasing.

Since PCB levels have remained stable, or decreased, it appears that the encapsulant material is intact and functioning properly. Access to encapsulated areas on campus is restricted, significantly reducing the potential for human exposure to PCBs. Based upon these observations, it may be appropriate to reduce the sampling frequency at SUNY New Paltz.

Thank you for your assistance and support throughout this lengthy and complex remediation effort. If you have any questions please call me at (845) 794-2045 or (845) 256-3148.

Sincerely,

Mark Knudsen
Regional Toxics Coordinator

Encl.
